

How to fix the Cordpack or Battery of your Laube Lazor so it doesn't fall out anymore

Northern Tails Sharpening. Mobile Alabama. 251-232-5353 www.northerntails.com

Here is one of many ways to fix the cordpack or battery of your Laube clipper, when it won't stay locked in the clipper anymore. It's a simple procedure even you can do.

Laube uses a very simple connection system that looks exactly like the "snap" on a denim jacket. Its is an "electrical" connector but it looks just like a snap and has both of the snap parts. The only tool required for this is a pair of needle nose pliers.

Look at the terminals on the end of your cordpack or battery. There are four "female" connectors here that almost look like that same part of the "snap"

Now look down inside your clipper housing where the cordpack or battery fits into. There are four "male" connectors that almost look like the same part of the "snap". The problem we have is that over time as these connectors have come together countless times, the male part has spread apart the sides of the female part. Now, it doesn't want to snap together and hold like it did when it was new.

To fix this problems, grab your needle nose pliers. With your pliers, gently squeeze the sides of the female connector so they move just a very little bit There's not much of the connector sticking above the surface of the face-plate, but you can still bend them slightly. Don't bend them in too far or you'll have t bend them outward again. This will tighten this connector so it will "snap" on the male connector, keeping the cordpack or battery from falling out anymore. Good Job!

If you've done it correctly, you should be able to re-insert your cordpack or battery and it will snap into the other connector securely. You may have to push it hard the first time to snap it.

If by chance you bent the female connector too far inward, it may be too far over to let the connectors snap together at all. To fix this just get your needle nose pliers and slightly bend the side of the female connector outward if it looks to be too far in. The connectors should snap together now. Good Job!!
